

HIGHTEC RADIATOR LEAK STOP / KÜHLERDICHTMITTEL

Radiator sealant. Seals leaks in the cooling system immediately, reliably and permanently.

Description

HIGHTEC RADIATOR LEAK STOP / KÜHLERDICHTMITTEL reliably seals small leaks that cannot be localised immediately.

Application

HIGHTEC RADIATOR LEAK STOP / KÜHLERDICHTMITTEL repairs minor damage to the entire cooling and heating system quickly and reliably by sealing. It closes small cracks or repairs damage to the radiator caused by highway stones. It also repairs sealing ring leaks in the water pump and porous areas in hoses or heat exchangers. It even seals cracks in the cylinder head, depending on its existing condition. The radiator water level must be checked before addition. In the case of warm engines (Attention: Risk of scalding! Please observe the instructions in the vehicle's manual!) and open heating valves, add HIGHTEC RADIATOR LEAK STOP / KÜHLERDICHTMITTEL to the cooling system either directly or via the compensation tank. Then fill the fluid level up to the maximum mark with coolant.

Advantages

- Quick and reliable sealing of small leaks
- No disassembly work
- Outstanding combination of agents with a reliable, permanent sealing effect
- It does not harden in water (permanently flexible) and can be rinsed out again as needed
- No failure of heating taps and thermostats owing to corrosion protection
- Suitable for all water radiators
- Compatibility with all commercially available antifreeze and cooling liquids
- suitable for preventive protection against coolant loss and corrosion

Notes

Please always check the fluid level regularly after every application. HIGHTEC RADIATOR LEAK STOP / KÜHLERDICHTMITTEL is not suitable for repairing serious mechanical damage to the cooling system. Dosing - One dose is sufficient for 12 litres of coolant
